

Developed and recommended by scientists.

The very high-quality plant extracts combined in Virmune® are epigenetically effective and can thus reduce the likelihood of a virus infection and, in the event of an infection, alleviate the course. *

This phytoceutical-based therapy management was developed in collaboration with the Swiss research group Bluezones® and HealthBioCare to fight viruses.

The Virmune® phytonutrients have been precisely tailored to modulate synergistically and are scientifically well documented in the fight against viruses such as flu or corona. Studies also show positive results for Dengue and Zika viruses.

Virmune® has the potential to improve the effectiveness of some drugs used to treat COVID-19 and to reduce their toxicity.

To determine an increased need for nutrients, we also recommend the analysis of epigenetic biomarkers (micro RNAs) to prevent acute damage and long-term effects of viral infections.

Natural, vegan and tasteless. One capsule contains: **sage extract (polyphenols), onion extract (quercetin), grape skin extract (resveratrol), berberine, green tea extract (EGCG), elderberry extract (anthocyanin), apple extract (phloretin), vitamin D3, zinc and folic acid.**

The daily dose (one capsule) of Virmune® contains concentrated phytonutrients as found in a total of 30g of sage, 300g onions, 29 liters of apple juice, one liter of high-quality green tea, 1.4kg of grapes and 50g of elderberries.

A dietary supplement does not replace a healthy diet but supports in times of increased needs.

A scientifically proven combination of several extracts offers the best antiviral protection using synergistic mechanisms.

* A targeted phytoceutical therapy approach can reduce the likelihood of infection with SARS-Cov-2 or weaken the course of an infection (Adem et al., 2020).

Viruses such as the coronavirus cannot change human DNA - but they interfere with the regulation of genes. In this way, viruses weaken the immune system, the infection spreads in the body and is transmitted from person to person.

This mechanism can be influenced by the combination of epigenetically effective plant extracts.

In addition to frequent hand washing, keeping your distance and a healthy diet, a dietary supplement with the right plant extracts can strengthen the body's defenses and possibly reduce or control the risk of SARS-Cov-2 infection.

Because viruses are constantly changing, they are difficult to control. Ultimately, the immune system is responsible for clearing the infection. Vaccinations and antiviral drugs are very important in the prevention and treatment of viral diseases, but they are not available for all viruses and can cause side effects.

It is therefore important to actively support the immune system and to adequately cover additional nutrient requirements.

Protect your health with the combined power of plant extracts.
